Amendments to the Claims:

A listing of the entire set of pending claims (including amendments to the claims, if any) is submitted herewith per 37 CFR 1.121. This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1-15 Canceled

16. (New) A method comprising:

processing a plurality of frames to provide a stream of packets that includes the plurality of frames and a set of localizing data that facilitates distinguishing locations of frame header information and frame data of each frame within the stream of packets, and

including one or more of the set of localizing data in one or more packets of the stream of packets.

17. (New) The method of claim 16, including

distinguishing the location of frame data in each frame, based on the localizing data,

encrypting the frame data of each frame to provide encrypted frame data, and providing the encrypted frame data as the frame data of each frame within the stream, and

providing a second stream of data that includes the frame header information and the encrypted frame data of each frame and localizing data that facilitates distinguishing locations of the frame header information and the encrypted frame data within the stream.

18. (New) The method of claim 16, wherein
the localizing data facilitates distinguishing encrypted and non-encrypted
content of the stream of packets.
19. (New) The method of claim 16, wherein
the one or more of the localizing data is included in header information of the
one or more packets.
20. (New) The method of claim 16, wherein
the stream of packets corresponds to a stream of RTP-packets.
21. (New) The method of claim 16, wherein
each packet of the stream of packets includes at least one of: a partial frame,
and one or more full frames.
22. (New) The method of claim 16, wherein
the one or more of the localizing data is included in hint tracks of the stream of
packets.
23. (New) The method of claim 16, including
transmitting the stream of packets to a remote system.
24. (New) A system comprising:
a first buffer that is configured to receive a plurality of frames,
a processor that is configured to process the plurality of frames to:
create a stream of packets that includes the plurality of frames and a
set of localizing data that facilitates distinguishing locations of frame header
information and frame data of each frame within the stream, and
include one or more of the set of localizing data in one or more packets
of the stream of packets.

25. (New) The system of claim 24, including
 an encryption module that is configured to:
 distinguishing the location of frame data in each frame, based on the
localizing data,
 encrypt the frame data of each frame to provide encrypted frame data,
and
 provide a second stream of packets that includes the frame header
information and the encrypted frame data of each frame and localizing data that
facilitates distinguishing locations of the frame header information and the encrypted
frame data within the stream.
26. (New) The system of claim 25, wherein
 the encryption module is configured to transmit the second stream of packets
to a remote system.
27. (New) The system of claim 24, wherein
 the localizing data facilitates distinguishing encrypted and non-encrypted
content of the stream of packets
28. (New) The system of claim 24, wherein
 the one or more of the localizing data is included in header information of the
one or more packets.
29. (New) The system of claim 24, wherein
 the stream of packets corresponds to a stream of RTP-packets.
30. (New) The system of claim 24, wherein
 each packet of the stream of packets includes at least one of: a partial frame,
and one or more full frames.

31. (New) The system of claim 24, wherein
the one or more of the localizing data is included in hint tracks of the stream of packets.
32. (New) The system of claim 24, including
a transmitting module that is configured to transmit the stream of packets to a remote system.
33. (New) A system including
a receiver that is configured to receive a stream of packets, and
a processor that is configured to process the stream of packets to distinguish frame header information and frame data of a plurality of frames within the stream of packets, based on localizing data that is included within the stream of packets.
34. (New) The system of claim 33, including
a decryptor that is configured to:
extract the frame data from the stream of packets, based on the localizing data, and
decrypt the frame data to provide decrypted frame data.
35. (New) The system of claim 34, including
a processor that is configured to process the frame header information and decrypted frame data to provide content information to a user application.
